2017 Lake Erie Regional Grape Program Summer Growers’ Conference
August 11, 2017
Cornell Lake Erie Research and Extension Laboratory
6592 West Main Road, Portland, NY 14769

Agenda

7:30 AM    Tradeshow set up begins
8:30 AM    Registration and Tradeshow open
9:00 AM    Welcome – Tim Weigle

9:10 - 9:45 AM    Using the Grape Berry Moth Model on NEWA
  Tim Weigle, NYS IPM Program and Andy Muza, LERGP, Penn State

9:45 – 10:15 AM    Managing Resistance and Late Season Fungicide Applications
  Bryan Hed, LERGP, Penn State

10:15 – 10:45 AM   Insect Update
  Jody Timer, LERGP, Penn State

10:45 – 11:45 AM   Update on Changes in the Worker Protection Standard Regulations
  Michael Nierenberg, NYS Department of Environmental Conservation

11:45 – Noon      Excellence in IPM Award Presentation – Jennifer Grant

Noon – 1:30 PM   Lunch and Visit Tradeshow

1:30 – 2:00 PM    Precision Vineyard Imaging
  Dr. Stephen Nuske, Carnegie Melon University

2:00 – 2:30PM    Variable Rate Shoot Thinning – The How’s and Why’s
  Jackie Dresser and Rhiann Jakubowski, Lake Erie Regional Grape Program

2:30 – 3:00 PM    “Efficient Vineyard” SCRI Project Update
  Terry Bates, LERGP, CLEREL Director

3:00 – 3:30 PM    Economics of Using Cover Crops
  Kevin Martin, LERGP, Penn State

3:30 – 4:00 PM    Efficient Vineyard Project
  James Taylor, New Castle University

4:00 PM    Adjourn
Important Dates!

Don’t forget to register!

Register Now!!!!

Friday, August 11 - LERGP Summer Grower Conference- come join us in celebrating 25 years of service! See registration information at end of this Crop Update!

PESTICIDE CREDITS available for this meeting!

Growers....tell your neighbors and friends!!!

Saturday, August 12 - LERGP Open House-
We would like to invite our neighbors to see what it is that we do here at CLEREL. There will be hayride tours of the facility and a hot dog lunch afterwards. The event begins at 10:00am with opening statements from Senator Cathy Young, Assemblyman Andy Goodell, Director of Extension, Chris Watkins and Director of the NYSAES in Geneva, Jan Nyrop, and Director of NYSIPM, NYSAES in Geneva, Jennifer Grant
Brix Testing for Harvest Management

Management decisions for 2017 are winding down rapidly. There are some powdery mildew concerns, a potential berry moth spray and ramping up for 2017 harvest. The cost and value of a berry moth spray will be highly site specific and related to current year conditions. As far as powdery mildew and harvest management are concerned, it really comes down to crop load.

While crop load decisions are basically finalized, how and when that crop gets ripe should be predicted, monitored, and re-predicted. There is not much worse than unexpectedly low brix after setting up a harvest crew for a block and having to cancel loads or move to another location. Perhaps a little worse is having a customer for custom harvest incorrectly predict brix and delay or cancel a load.

Labor costs during harvest are some of the highest per hour that growers deal with. While growers charge by the ton, their costs are incurred by the hour. Coming across unexpectedly low brix usually results a small number of wasted tractor hours and a larger number of wasted labor hours. Bulk harvest operations, MOG devices and flexible management strategies can reduce both by nearly 50%.

Conservative crop load management strategies are recommended and make harvest management relatively easy. Significant amounts of brix testing can reduce nearly all waste related to unexpected fruit maturity. Nearly all of the costs incurred will be unpaid labor at a time of year when most growers are not anywhere near their busiest. For the largest growers, robust brix testing might take a couple of days. Some even use paid labor to assist in obtaining enough samples to ensure adequate results.

Some crop estimation done by CLEREL staff did show a potential for highly variable crops this year. This is likely due to drought stress and other factors that influence vine size and 2017 crop potential. As a result, there will be some sites that are likely to have highly variable brix and ripening curves. A single sample will probably not provide adequate sampling results in many blocks. That’s not to say a 16.25 test will not be delivered at 16.25, there is just a high probability that such a result would be luck.

Investing a mere $1 per acre in sampling offers the potential to save $30 or more per acre at harvest. If somebody else harvests your grapes you’re not likely to save any money by sampling. You will save yourself the irritation of the harvest operator you’re trying to maintain a relationship with. While it influences my decision making when setting rates, I don’t set custom harvest rates. While I might be a big fan of the good guy discount, there is not much evidence that the market (and operators) agree.
Crop insurance is a safety net for farmers that helps you manage risk. If you have a crop failure, crop insurance can help you farm again next year.

Important Insurance Deadlines

- **Aug. 15, 2017:** Premium Billing Date
- **Nov. 20, 2017:** Sales Closing, Policy Change, Cancellation, Termination Date
- **Nov. 20, 2017:** End of Insurance Period
- **Jan. 15, 2018:** Acreage / Production Report Date

Over 40 grape varieties are insurable in these counties:

- Cattaraugus
- Chautauqua
- Erie
- Niagara
- Ontario
- Schuyler
- Seneca
- Steuben
- Suffolk
- Ulster
- Wayne
- Yates

Grapes in other counties may be insured by written agreement from RMA.

**NYS Grape Crop Insurance Performance**

For every $1 grape producers spent on crop insurance premiums from 2012 to 2016, they received $2.07 in losses paid, on average.

Explore your personalized crop insurance costs and loss payments under different yield outcomes at ag-analytics.org.

To sign up, contact a crop insurance agent. Find an agent using the Agent Locator tool at rma.usda.gov/tools/agent.html.
Core Credits, an International Speaker and a Catered Lunch

And all in the air conditioned comfort of the CLEREL meeting room. What more could you ask for? Time is running out to register for the LERGP Summer Growers’ Conference and seating is limited so you should act now!

Why should you attend the conference? Do you find the changes to the Worker Protection Standard regulations confusing? Have you heard all the chatter at the Coffee Shop about sensors and variable rate technology? How about why there is so much late season grape berry moth damage and what can be done about it? The answer to these questions and more are available – along with the highly sought after pesticide recertification credits (2.5 for NY and 5 for PA, along with 2.0 Core credits) – at the LERGP Summer Growers’ Conference on August 11, 2017 at the Cornell Lake Erie Research and Extension Laboratory (CLEREL) 6592 West Main Road, Portland, NY.

The conference will be held in the CLEREL meeting room and will start at 9AM and adjourn by 4 PM. The cost includes a day of education and a catered lunch and is a bargain at $20 for members of LERGP. With online pesticide credits going at $30 per credit it is like you are paying yourself $55 to attend. Following are the talks and presenters for this year’s conference.

Using the Grape Berry Moth Model on NEWA - Tim Weigle, NYS IPM and Andy Muza, LERGP Penn State

Managing Resistance and Late Season Fungicide Applications - Bryan Hed, LERGP, Penn State

Insect Update - Jody Timer, LERGP, Penn State

Update on Changes in the Worker Protection Standard Regulations - Michael Nierenberg, NYS DEC

Precision Vineyard Imaging - Dr. Stephen Nuske, Carnegie Melon University

Variable Rate Shoot Thinning – The How’s and Why’s - Jackie Dresser and Rhiann Jakubowski, LERGP

“Efficient Vineyard” SCRI Project Update - Terry Bates, LERGP, CLEREL Director

Economics of Using Cover Crops - Kevin Martin, LERGP, Penn State

Efficient Vineyard Project - James Taylor, New Castle University

To register, visit the LERGP website https://lergp.cce.cornell.edu/ and look in the Upcoming Events section in the lower right hand corner of the home page or contact Kate at 716.792.2800.

Grape Berry Moth

As shown in the table below, all areas are at the point where scouting for grape berry moth should take place to determine the need for additional insecticide applications. At this timing, use a threshold of 15% damaged clusters or more to trigger an insecticide application. A “damaged” cluster is defined as a cluster that has one or more berries with grape berry moth damage. Damage is pretty easy to see at this time of year, especially with
red or purple varieties, like Concord, where a purple halo, or sting, shows where the larvae has hatched from the egg and ate its way into the grape.

If the threshold has been reached, or exceeded, in a vineyard plan on applying an insecticide at 1620 DD. For most stations, this will be toward the middle or end of next week (August 7 – 11). As always, the best method to use in determining spray timing for GBM is the grape berry moth degree day model found on NEWA http://newa.cornell.edu that allows you to enter the specific wild grape bloom date (used as the biofix to start accumulating degree days for the model) found at your vineyard.

If you have any questions on implementing the GBM model in your vineyard operation, please get in touch with me thw4@cornell.edu or 716.792.2800

* Estimated date provided by NEWA website
In the Vineyard (8-3-17)

Insects

Grape Berry Moth –
According to the GBM Degree Day Model in NEWA [http://newa.cornell.edu/index.php?page=berry-moth], “Prepare to scout all vineyard blocks for grape berry moth damage when DD accumulation reaches 1470 – 1620 DD. During scouting, determine if the number of damaged clusters from previous generation exceeds the treatment threshold of 15%. If above threshold, control measures should be applied starting at 1620 DD.” At least 1 site in the region will reach the 1620 DD by as early as this Monday (August 7). Scout now to determine treatment threshold levels at your sites and check the NEWA site closest to your vineyards to determine when 1620 DD are expected to be reached.

Japanese Beetle – although leaf injury may be evident in vineyards very few beetles were found this week. Throughout the region the Japanese beetle threat should be winding down but problems in each block are different. Your specific site may still have pockets of adult beetles feeding on leaves but you won’t know what the population levels are unless you continue scouting. As mentioned last week, visually leaf injury levels can appear to be high but considering the size of Concord canopies the actual leaf area injured is often low. Keep this in mind before you decide to spend the time and money on an insecticide application.

Grape Leafhopper – leaf injury ranges from very spotty and hard to find to easily visible depending on the block. While scouting for GBM also be aware of GLH leaf injury levels. Check 4 different areas in the vineyard (2 exterior and 2 interior). At each area look at lower leaves on shoots and check for leaf feeding. If No – Minimal injury is observed, proceed to the next sampling site. If Moderate - Heavy leaf stippling is observed then begin counting nymphs on the undersides of leaves (Figure 1). Examine 5 leaves (leaves 3-7 from base of shoot)/ shoot on 5 different shoots at each location. If a threshold of 5 nymphs/ leaf is reached then an insecticide application is recommended. Blocks with heavy crop loads and high GLH populations may benefit from an insecticide application.

Diseases

Black Rot and Downy Mildew – the dry weather throughout the region in July has kept the incidence of these diseases from very low to nonexistent in Concord and Niagara vineyards. These diseases are not expected to cause problems in Concord and Niagara vineyards this season. However, scouting for downy mildew should be continued in susceptible varieties (including Niagaras) if rainfall events increase as the season progresses.

Powdery Mildew – distorted, cupped leaves near shoot tips continues to be the most evident symptom of this disease in vineyards (Figure 2). As mentioned in the last Crop Update, growers that have Concord blocks with heavy crop loads should consider whether an additional fungicide application is needed. Fungicide applications for powdery mildew should continue in blocks with susceptible wine varieties.

Figure 2. Distorted, cupped Concord leaves caused by powdery mildew infections. Photo: Andy Muza, Penn State.
Welcomes our neighbors, near and far, to come celebrate 25 years of service with us. We are holding an Open House with hayrides through the vineyards, food and a chance for us to let people know what we do here. This is a FREE event!

- **When:** Saturday, August 12, 2017
- **Time:** 10:00am - 1:00pm (hayrides on the half hour)
- **Where:** CLEREL (Cornell Lake Erie Research & Extension Laboratory)
  6592 West Main Rd.
  Portland, NY 14769

Make Sure You Are Counted In The Census of Agriculture

Currently, the census is the only complete count of U.S. farms and ranches and the people who operate them. It includes even the smallest plots of land – rural or urban – growing fruits, vegetables, or raising food animals, if $1,000 or more of such products were raised and sold, or normally would have been sold, during the census year. The information produced by the Census of Agriculture guides Congress, agribusiness, policymakers, researchers, local governments and many others on the creation and funding of agricultural programs and services – decisions that can directly impact your local operations and the future of the agriculture industry for years to come.

Please note that new farmers or existing farmers who have not participated in a prior Census of Agriculture still have time to sign up to be counted through the end of June at https://www.agcounts.usda.gov/cgi-bin/counts/. The survey takes less than a minute – and will ensure that you receive a Census form (that you can fill out in paper form or online.) If a farmer/rancher is not on our list frame by June 30th, 2017, the producer will not have an opportunity to participate in the 2017 Census of Agriculture.

For more information about the census, please visit www.agcensus.usda.gov, follow NASS on Twitter @usdanass, or call (800) 727-9540.

This is a list for organizations that provide services to beginning farmers in the Northeastern US.

To unsubscribe from this list, send a plain text email message to bflearningnetwork-L-request@cornell.edu with the word “leave” in the body of the message.

To join the list, follow the above instructions but type «join» in the message body.
THE 2017 CENSUS OF AGRICULTURE IS COMING!
